J. Bacteriol. 179:7135-7155(1997)
-!- CATALYTIC ACTIVITY: Pyruvate + CoA + oxidized ferredoxin = acetyl-
CoA + CO(2) + reduced ferredoxin.
-!- COFACTOR: Binds 2 4Fe-45 clusters.
-!- SUBUNIT: Heterotetramer of one alpha, one beta, one delta and one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- SIMILARITY: Belongs to the bacterial-type ferredoxin family.
-!- CAUTION: THERE SEEMS TO BE A SEQUENCING ERROR THAT FUSES TOGETHER
PORC AND PORD. WE HAVE CUT THE ORF INTO ITS TWO CONSTITUENTS.

"Niemann-Pick Cl disease: the 11061T substitution is a frequent mutant
allele in patients of Western European descent and correlates with a
classic juvenile phenotype."; Yamamoto T., Nanba E., Ninomiya H., Higaki K., Taniguchi M., Zhang H., Akaboshi S., Watanabe Y., Takeshima T., Inui K., Okada S., Tanaka A., Sakuragawa N., Millat G., Vanier M.T., Morris J.A., Pentchev P.G., type D (NPD) [MIM:257250]; also known as Niemann-Pick disease without sphingomyellinase deficiency, or Nova Soctian type. Because of evidence from biochemical changes, lack of complementation, and linkage mapping to the same chromosome site, NPD and NPC1 are MEDLINE=21313105; PubMed=11333381; Millat G., Marcais C., Tomasetto C., Chikh K., Fensom A.H., Harzer K., Wenger D.A., Ohno K., Vanier M.T.; Minemann-Pick CI disease: correlations between NPCI mutations, levels of NPCI procesin, and phenotypes emphasize the functional significance of the putative sterol-sensing domain and of the cysteine-rich MEDLINE=21313111, PubMed=11349231, Sun X., Marks D.L., Park W.D., Wheatley C.L., Puri V., O'Brien J.F., Kraft D.L., Lundquist P.A., Patterson M.C., Pagano R.E., Snow K.; Minemann-Pick C variant detection by altered sphingolipid trafficking and correlation with mutations within a specific domain of NPC1."; type C1 (NPC1) [MIM:257220]. NPC1 is an autosomal recessive lipid storage disorder, which affects particularly the brain, liver and spleen, and which is characterized by lysosomal accumulation of low density lipoprotein derived cholesterol. Clinical features include variable hepatosplenomegaly and severe progressive include variable hepatosplenomegaly and severe progressive. The age of onset can vary from infancy to late adulthood. DISEASE: Defects in NPC1 are the cause of Niemann-Pick disease endosomes and lysosomes. -!- DOWAIN: A cysteine-rich N-terminal domain and a C-terminal domain Mutations in NPC1 highlight a conserved NPC1-specific cysteine-rich "NPC1 gene mutations in Japanese patients with Niemann-Pick disease type C."; containing a di-leucine motif necessary for lysosomal targeting are critical for mobilization of cholesterol from lysosomes. PTM: Glycosylated. DISEASE: Defects in NPC1 are the cause of Niemann-Pick disease type C1 (NPC1) [MIM:257220]. NPC1 is an autosomal recessive lip Greer W.L., Dobson M.J., Girouard G.S., Byers D.M., Riddell D.C., Neumann P.E.; Ribeiro I., Marcao A., Amaral O., Sa Miranda M.C., Vanier M.T., Millat G.; AND VARIANTS ARG-215; VAL-858 AND GLN-1266 VARIANTS NPC1 ALA-378; MET-950; ARG-992 AND THR-1061. STRAIN-CD-1; TISSUE=Kidney;

Ota K., Kumar A., Wada J., Liu Z., Kanwar Y.S.;

Submitted (APR-1995) to the EMBL/GenBank/DDBJ databases.

-! FUNCTION: Structural component of connective tissue microfibrils that binds calcium. Fibrillin-1-containing microfibrils provide long-term force bearing structural support.

-! FTW: Forms intermolecular disulfide bonds either with other fibrillin-1 molecules or with other components of the microfibrils (By similarity).

-! SIMILARITY: Contains 47 EGF-like domains.

-! SIMILARITY: Contains 7 TGF-beta binding protein (TGFBP) domains.

                                                                                                                                                                                                                                                                                                                                                                              The DNA sequences of the invention and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the DNA sequences. Specific uses are described for each of the DNA sequences of proteins, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurological disorders, leukaemias, diseases of the immune system (including allergies or asthma), hepatic disease, Alzheimer's and cognitive disorders, schizophrenia, prostate diseases, alzheimer's and disorders and AIDS. The polypeptides are also useful for identifying their binding partners.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                    This sequence is encoded by a cDNA of the invention, designated Gene No. 13. This sequence represents a human secreted protein, and is expressed in keratinocytes and to a lesser extent in endothelial

                                                                                                                                                                                                                                                                                             This is the amino acid sequence of a transmembrane protein encoded by human liver cDNA clone HP10432 (see AAV84374). The encoded protein has a signal-like N-terminal region and one internal transmembrane domain. The invention provides nucleotide sequences (see AAV84359-76) coding for 18 transmembrane proteins (see AAW88491-508), vectors containing such polynucleotides, and eukaryotic cells containing the vectors. The proteins can be used as antigens or as compositions in the preparation of antibodies against the proteins. The polynucleotides can be used as probes for gene diagnosis, and as gene sources for gene therapy and large-scale production of proteins encoded by the cDNA. The host cells are used for the detection of ligands corresponding to the expressed proteins, and the screening of low mol.wt. medicines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        transmembrane proteins designated HTMPN-1 to HTMPN-79, respectively. The transmembrane protein have immunospecific, antiproliferative and neuroprotective activities. The human transmembrane proteins, polynucleotides encoding them and other compositions and methods from the present invention, can be used for the diagnosis, treatment or prevention of immune, reproductive, smooth muscle, neurological, gastrointestinal, developmental and cell proliferative disorders. The HTMPN's can be used to treat or prevent disorders associated with a decreased expression or activity of HTMPN.
                                                                                            Proteins, polynucleotides, vectors, host cells and antibodies used to diagnose, treat or prevent immune, reproductive, smooth muscle, neurological, gastrointestinal, developmental and cell proliferative
                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Page 163; 229pp; English.

Modulating angiogenesis in a mammal for treating diseases mediated by angiogenesis, e.g. solid tumours and vascular deficiencies of cardiac or peripheral tissue, by administering antagonist or agonist of TWEAK

Example 1; Fig 1; 46pp; English.

TWEAK protein is a member of the tumour necrosis factor (TNF) family and induces angiogenesis. TWEAKR may therefore be used to screen for and develop TWEAKR agonists into the modulation of angiogenesis, to be used in the treatment and diagnosis of human disease. The disorders mediated by angiogenesis include ocular disorders characterised by ocular neovascularisation such as diabetic retinopathy, neovascular glaucoma, retinoplastoma, retinopathy of prematurity, retrolental fibroplasia, rubeosis, uveitis, macular degeneration and corneal graft neovascularisation, and inflammatory diseases such as arthritis, rheumatism and psoriasis. Other treatable diseases include malignant and metastatic conditions such as sarcomas and carcinomas, The sequence represents the human TWEAK receptor (TWEAKR) protein. The benign tumours and preneoplastic conditions, myocardial angiogenesis, haemophilic joints, scleroderma, vascular adhesions, atherosclerotic plaque neovascularisation, telangiectasia, wound granulation, coronary atherosclerosis, peripheral atherosclerosis and ischaemia.

```
The invention relates to a purified protein (I), comprising one of 90 fully defined sequences (ABP61424-ABP61513) or a protein based on any of the sequences but with some amino acids deleted, substituted or added and with a NF-KB (nuclear factor Kappa B) activating effect. The protein and encoding gene (ABQ91912-ABQ92001) are useful in diagnosis and screening inhibitors or promoters to control excessive activation or inhibition and for treating e.g. inflammations, autoimmune diseases, cancers, inflammations, autoimmune diseases or ischaemic infections, bone diseases, AIDS, neurodegenerative diseases or ischaemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    vulnerary; TWEAK agonist; Fn14 agonist, angiogenesis; tumour progression; tumour necrosis factor family; TNF family; TWEAK receptor; myocardial ischaemic condition; myocardial infarction; wound healing; burn healing; gastric ulcer; tissue transplantation; organ transplantation; neovascularisation; vascular insufficiency; cancer; inflammatory macular degeneration; diabetic retinopathy.

The invention describes methods of modulating angiogenesis and inhibiting tumour progression using TWEAK (a novel member of the tumour necrosis factor or TWF family) receptor agonists. Conditions which can be treated using the agonists include myocardial ischaemic conditions (e.g. myocardial infarction), wound healing (e.g. burn healing and healing of gastric ulcers), and tissue and organ transplantations to promote neovascularisation, particularly in subjects suffering from vascular insufficiency (e.g. diabetic patients). Inhibition of angiogenesis and subsequently neovascularisation is useful in treatment of cancer, inflammatory macular degeneration and diabetic retinopathy. This sequence represents the human type I transmembrane protein Fn14, a TWEAK receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lung cancer-associated polypeptide; cytostatic; emphysema; atelectasis; antiinflammatory; antiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer, benign lesion; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                09

cancer-associated polymucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer, such as small cell lung cancer, nor other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial aul monary disease, fibrosis, hypersensitivity pneumonitis, interstitial and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as an antibodies. Sequences ABU56408-ABU5675 represent lung cancer-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung

Mouse type 1 transmembrane protein Fn14.

tumour progression; Type 1 transmembrane protein Fn14; mouse; cytostatic; cardiant; vulnerary; TWEAK agonist; Fn14 agonist; angiogenesis; tumour progress tumour necrosis factor family; TNF family; TWEAK receptor; myocardial ischaemic condition; myocardial infarction; wound healing; burn healing; gastric ulcer; tissue transplantation; organ transplantation; necvascularisation; vascular insufficiency; cancer; inflammatory macular degeneration; diabetic retinopathy.

The invention describes methods of modulating angiogenesis and inhibiting tumour progression using TWEAK (a novel member of the tumour necrosis factor or TNR family) receptor agonists. Conditions which can be treated using the agonists include myocardial ischaemic conditions (e.g. myocardial infrarction), wound healing (e.g. burn healing and healing of agastric ulcers), and tissue and organ transplantations to promote neovascularisation, particularly in subjects suffering from vascular insufficiency (e.g. diabetic patients). Inhibition of angiogenesis and subsequently meavascularisation is useful in treatment of cancer, inflammatory macular degeneration and diabetic retinopathy. This sequence represents the mouse type 1 transmembrane protein Fn14, a TWEAK receptor modulating angiogenesis and inhibiting tumour progression, 0; SDPCLGCAAAPPAHFRLLWPILGGALSLVLVLVLALVSSFLVWRRCRRREKFTTP 61 SDFCLGCAAAPPAPFRLLWPILGGALSLTFVLGLLSGFLVWRRCRRERSSPPP Length 129; Indels / Match 74.0%; Score 450; DB 23; 1 Local Similarity 75.2%; Pred. The sequence represents a fusion protein consisting of the human TWEAK receptor (TWEAKE) protein extracellular domain fused to an Fc portion from human IgG1. This fusion protein, TWEAKEF, is used in the preparation of TWEAKE agonists and antagonists. The TWEAK protein is a member of the tumour necrosis factor (TNF) family and induces angiogenesis. TWEAKE may therefore be used to screen for and develop TWEAKE agonists for the modulation of angiogenesis, to be used in the treatment and diagnosis of human disease. The disorders mediated by angiogenesis include ocular disorders characterised by ocular neovascularisation such as diabetic retinopathy, neovascular glaucoma, retinopathy of prematurity, retrolental fibroplasia, rubecosis, uveitis, macular degeneration and corneal graft neovascularisation, and inflammatory diseases such as arthritis, rheumatism and psoriasis. Other treatable diseases include malignant and members and the conditions such as sarconas and carcinomas, benign tumours and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          preneoplastic conditions, myocardial angiogenesis, haemophilic joints, scleroderma, vascular adhesions, atherosclerotic plaque neovascularisation, telangiectasia, wound granulation, coronary atherosclerosis, peripheral atherosclerosis and ischaemia.

the polymetroclus sequences it will apply the human secreted proteins given in APV91451 to APV91651. The human secreted proteins given in APV91451 to APV91651. The human secreted proteins can have activities based on the tissues and cells they are artially antimidiammatory; nootropic; neuroprotective; antiallergic; osteopathic; antiarthritic; antibacterial; antidiabetic; antiallergic; osteopathic; antiarthritic; antibacterial; antidiabetic; antiallergic; osteopathic; antiarthritic; antibacterial; antidiabetic; corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the proteins in a sample or by determining the presence of mutations in the polymucleotides. Specific uses are described for each of the polymucleotides based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, hepatic and renal disease, inflammation, allergies, allaheimer's and behavioural disorders, schizophrenia, cardiovascular disorders, aethmat, sepsis, acre, poorlassis, cardiovascular disorders aethma, sepsis, acre, poorlassis, cardiovascular disorders aethma, sepsis, acre, poorlassis, cardiovascular disorders aethmat, the proteins of polymucleotides can also be used as food additives or preventives. partners. The proteins are also useful for identifying their binding AAA26337 to AAA26345 and AAY91450 are sequences used in the exemplification of the present invention. The polynucleotide sequences given in AAA26346 to AAA26458

```

```
human secreted proteins given in AAV91451 to AAV91691. The human secreted proteins can have activities based on the tissues and cells they are expressed in. Examples of the activities are: cytostatic. immunosuppressive; antiHIUV; antiHIIINT antiHIINT antiH
                                                                                                                                                                                                                                        Human, secreted protein, diagnosis, cytostatic, immunosuppressive, antiHIV, antiinflammatory; nootropic; neuroprotective, antiallergic; osteopathic; antiarthritic, antibacterial, antidiabetic; antiathritic, antibactery, ancerial, antidiabetic antiathma; antiporiatic; cardiant, plee therapy; cancer; neurological disorder; immune disease; inflammation; blood disorder; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polynucleotide sequences given in AAA26346 to AAA26458 encode the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated human genes and the secreted polypeptides they encode,

(HUMA-) HUMAN GENOME SCI INC.

The polynucleotide sequences given in AAA26346 to AAA26458 encode the human secreted proteins given in AAY91451 to AAX91691. The human secreted proteins given in AAY91451 to AAX91691. The human secreted proteins given in AAY91451 to AAX91691. The human secreted corrected makes activities based on the tissues and cells they are expressed in. Examples of the activities are: cytostatic; humanosuppressive; antiHIV; antiHIV; antiHIMIC; antiBacterial; antidiabetic; antiasthma; antipsoriatic; and cardiant. The polynucleotides and their corresponding secreted proteins are useful for preventing, treating or antiasthma; antipsoriatic; and each sequence by determining the amount of the proteins in a sample or by determining the presence of mutations in the proteins in a sample or by determining the presence of mutations in the proteins in a sample or by determining the presence of mutations in the proteins in a sample or by determining the diagnosis or treatment of colynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, allergies, Alzheimer's and behavioural diseases, inflammation, allergies, atthrities, infections, AlbS, spinal cord injuries,

transplant rejection, diabetes, asthma, sepsis, acne, psoriasis,

```
polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and feetal deficiencies, blood disorders, disease of the immune system, autoimmune diseases, hepatic and renal disease, inflammation, allergies, Alzheimer's and behavioural disorders, schizophrenia, osteoporosis, arthritis, infections, AIDS, spinal cord injuries, transplant rejection, diabetes, asthma, sepsis, acne, psoriasis, cardiovascular disorders, reproductive disorders, gastrointestinal disorders, respiratory disorders and metabolic disorders. The proteins or polynomial or preservatives. The proteins are also useful for identifying their binding partners.

AAA26337 to AAA26345 and AAY91450 are sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; BAFF receptor; BAFF-R; cytostatic; hypotensive; inflammation; TNF; Tumoux Necrosis Factor; autoimmune disease; immunosuppressive; cancer; myasthenia gravis; hypertension; organ transplantation; drug screening; HIV; human immunodeficiency virus; genetic disorder; cardiovascular; renal; rheumatoid arthritis; systemic lupus erythematosus; amyloidosis; haemolytic anaemia; Chagas' disease; Garave's disease; glomerulonephritis; multiple myeloma; chromosomal mapping; tissue typing; drug screening;

The invention relates to human BAFF receptor (BAFF-R) nucleic acids and proteins. BAFF-R is a B-cell activating factor belonging to the Tumour Decrosis Factor (INF) family, which is associated with the expression of B-cells and immunoglobulins. The BAFF-R proteins, DNA and antibodies are useful for treating, preventing or delaying autoimmune diseases, cancer, tumourigenic conditions or inherited genetic disorders involving B-cells, hypertension, cardiovascular disorders, immunosuppressive diseases, renal diseases, which can be treated or prevented by BAFF-R, include systemic lupus erythematosus, rheumatoid arthritis, myasthemia gravis, autoimmune haemlytic anaemia, idiopathic thrombocycopaemia purpura, Chagas' disease Grave's disease, anti-phospholipid syndrome, Negener's granulomatosis, poly-arteritis nodosa and rapidly progressive glomeralometoris, plasma cells disorders e.g., multiple myeloma, Maldenstrom's, macroglobulinaemia, heavy-chain disease, primary or immunocyte-associated amyloidosis, and monoclomal gammopathy of undetermined significance. The nucleic acids, protein, protein homologues, and antibodies may further be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       percenting assays, in detection assays (chromosonal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, or pharmacogenomic). The polypeptides are further useful as immunogens to raise anti-BFFR antibodies, or in screening drugs or compounds that modulate BAFF-R activity or expression. The present sequence is human BAFF-R protein mutant.

Note: The present sequence is not shown in the specification but is derived from human BAFF-R referred as SEQ ID NO: 5 (AAE22242) and shown
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         --E 107
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; BAFF receptor; BAFF-R; cytostatic; hypotensive; inflammation; TNF; Tumour Necrosis Factor; autoimmune disease; immunosuppressive; cancer; myasthenia gravis; hypertension; organ transplantation; drug screening; HIV; human immunodeficiency virus; genetic disorder; cardiovascular; renal; rheumatoid arthritis; systemic lupus erythematosus; amyloidosis; haemolytic anaemia; Chagas' disease; Grave's disease; glomerulonephritis; multiple myeloma; chromosomal mapping; tissue typing; drug screening;

The invention relates to human BAFF receptor (BAFF-R) nucleic acids and proteins. BAFF-R is a B-cell activating factor belonging to the Tumour Necrosis Pactor (TNF) family, which is associated with the expression of B-cells and immunoglobulins. The BAFF-R proteins, DNA and antibodies are useful for treating, preventing or delaying autoimmune diseases, cancer, tumourigenic conditions or inherited genetic disorders involving B-cells, hypertension, cardiovascular disorders, immunosuppressive diseases, renal disorders, inflammation, organ transplantation and HIV. Autoimmune diseases, which can be treated or prevented by BAFF-R, include systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, autoimmune haemolytic anaemia, idiopathic thrombocytopaenia purpura, Chagas disease, anti-phospholipid syndrome, Wegener's granulomatosis, poly-arteritis nodosa and rapidly progressive glomerulonephritis. Plasma cells disorders e.g., multiple myelona, Waldenstrom's macroglobulinaemia, monoclonal gammopathy of undetermined significance. The nucleic acids, protein, protein homologues, and antibodies may further be used in screening assays, in detection assays (chromosomal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic assays, monitoring clinical trials, or pharmacogenomic). The polypeptides are further useful as immunogen to raise anti-BFR antibodies, or in screening drugs or compounds that modulate BAFF-R activity or expression. present sequence is human BAFF-R protein mutant. e: The present sequence is not shown in the specification but is ived from human BAFF-R referred as SEQ ID NO: 5 (AAE22242) and shown New human BAFF receptor proteins and nucleic acids, useful for treating, preventing or delaying e.g. autoimmune diseases, cancers, inherited genetic disorders involving B-cells, cardiovascular substituted with Asn" /note= "Wild type Leu substituted with Pro" 'note= "Wild type Pro substituted with Gln" 'note= "Wild type Ala substituted with Thr" 'note= "Wild type Val Location/Qualifiers Example 17; Page -; 164pp; English. fig 2d of the specification. or renal disorders 18-SEP-2000; 2000US-233152P. 21-SEP-2000; 2000US-234140P. 13-FEB-2001; 2001US-268499P. 14-AUG-2001; 2001US-312185P. 06-SEP-2001; 2001WO-US28006. New human BAFF receptor proteins and nucleic acids, useful for treating, preventing or delaying e.g. autoimmune diseases, cancers, inherited genetic disorders involving B-cells, cardiovascular disorders, or renal disorders

Example 17; Page -; 164pp; English.

proteins. BAFF-R is a B-cell activating factor belonging to the Tumour Necrosis Factor (TNF) family, which is associated with the expression of B-cells and immunoglobulins. The BAFF-R proteins, DNA and antibodies are useful for treating, preventing or delaying autoimmune diseases, cancer, tumourigenic conditions or inherited genetic disorders involving B-cells, hyperension, cardiovascular disorders, immunosuppressive diseases, renal diseases, which can be treated or prevented by BAFF-R, include systemic diseases, which can be treated or prevented by BAFF-R, include systemic lupus erythemacosus, rheumatoid arthritis, myasthenia gravis, autoimmune haemolytic anaemia, idiopathic thrombocytopaenia purpura, Chagas' disease Grave's disease, anti-phospholipid syndrome, Wegener's granulomatosis, poly-arteritis nodosa and rapidly progressive glomerulomephritis. Plasma The invention relates to human BAFF receptor (BAFF-R) nucleic acids and

```
cells disorders e.g., multiple myeloma, Waldenstrom's, macroglobulinaemia, heavy-chain disease, primary or immunocyte-associated amyloidosis, and monoclonal gammopathy of undetermined significance. The nucleic acids, protein, protein homologues, and antibodies may further be used in screening assays, in detection assays (chromosomal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, or pharmacogenomic). The proprestic are further useful as immunogens to raise anti-BFFR antibodies, or in Screening drugs or compounds that modulate BAFF-R activity or expression. The present sequence is human BAFF-R protein mutant.

Note: The present sequence is not shown in the specification but is derived from human BAFF-R referred as SEQ ID NO: 5 (AAE22242) and shown in fig 2d of the specification.

                                                                                                       TRAF3 (By similarity).
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUB SPECIFICITY: Highly expressed in fetal heart, intestine, kidney, liver, lung and skin, and in adult heart and ovary. Intermediate expression in adult kidney, lung and skin.
INDUCTION: By fibroblast growth factor I (FGF1).
SIMILARITY: Contains I TNFR-Cys repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          28-FEB-2003 (Rel. 41, Last sequence update)

Note=No experimental confirmation available;
-!-TISSUE SPECIFICITY: Highly expressed in spleen and lymph node, and in resting B-cells. Detected at lower levels in activated B-cells, resting CD4+ T-cells, in thymus and peripheral blood leukocytes.
-!- SIMILARITY: Contains 1 TNFR-Cys repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              81 ------ILGGA---LSLTFVLGL-LSGFLVWRRCRR------E

J. FUNCTION: PROMOTES ADHESION OF ENDOTHELIAL CELLS THROUGH
INTERACTION OF INTEGRINS AND THE RGD MOTIF. COULD BE A VASCULAR
LIGAND FOR INTEGRIN RECEPTORS AND MAY FLAY A ROLE IN VASCULAR
DEVELOPMENT AND REMODELING.
J. SUBCELLULAR LOCATION: Secreted.
J. SUBCELLULARITY: Belongs to the fibulin family.
J. SIMILARITY: Contains 6 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        16-OCT-2001 (Rel. 40, Last sequence update)

"Niemann-Pick type C disease: NPC1 mutations associated with severe and mild cellular cholesterol trafficking alterations.",
Hum. Genet. 190:24-32 (2001).

-!-FUNCTION: INVOLVED IN THE INTRACELLULAR TRAFFICKING OF CHOLESTEROL. MAY PLAY A ROLE IN VESICULAR TRAFFICKING IN GLIA, A PROCESS THAT MAY BE CRUCTAL FOR MAINTAINING THE STRUCTURAL AND FUNCTIONAL INTEGRITY OF NERVE TERMINALS.

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. FOUND IN LATE ENDOSOMES AND LYSOSOMES.

-!- DOMAIN: A CYSTEINE-RICH N-TERMINAL DOMAIN AND A C-TERMINAL DOMAIN CONTAINING A DI-LEUCINE MOTIF NECESSARY FOR LYSOSOME.

PTM: GLYCOSYLATED.

The Firm: Call Collects in NPC1 are the cause of Niemann-Pick disease

Type C1 (NPC1) [MIM.257220]; an autosomal recessive lipid storage disorder, which affects particularly the brain, liver and spleen, and which is characterized by lysosomal accumulation of low density lipoprotein derived cholesterol. Clinical features include variable hepatosplenomegaly and severe progressive neurological dysfunction such as ataxia, dystonia and dementia. The age of onset can vary from infancy to late adulthood.

-1- DISEASE: Defects in NPC1 are the cause of Niemann-Pick disease without sphingomyelinase deficiency, or Nova Scotian type. Because of evidence from biochemical changes, lack of complementation, and linkage mapping to the same chromosome site, NPD and NPC1 are considered to be allelic disorders.

Submitted (APR-1995) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: STRUCTURAL COMPONENT OF CONNECTIVE TISSUE MICROFIBRILS
THAT BINDS CALCIUM. FIBRILLIN-1-CONTAINING MICROFIBRILS PROVIDE
-!- PIN: FORM FORCE BEARING STRUCTURAL SUPPORT.
-!- PIN: FORMS INTERNOLECULAR DISULFIDE BONDS EITHER WITH OTHER
FIBRILLIN-1 MOLECTULES OR WITH OTHER COMPONENTS OF THE
MICROFIBRILS (BY SIMILARITY)
-!- SIMILARITY: Contains 47 EGF-like domains.
-!- SIMILARITY: Contains 7 TGF-beta binding protein (TGFBP) domains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               inducing signaling complex (DISC) performs caspase-8 protectly activation which initiates the subsequent cascade of cappases (aspartate-specific cysteine proteases) mediating apoptosis. FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T-cells, or both (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Biochem.
